

Pre-1900 end-terrace

Do you have a house like this? See how your home could benefit from energy efficiency improvements.

A House Like Mine case study

EPC rating: Current 58 D
Potential 85 B

Occupants: Tenants, 5 adults
Details: End-terrace, 5 bedrooms, in conservation area
Floor area: 135 m² / 1,453 ft²
Walls: Solid
Floors: Suspended timber
Roof: Pitched with rooms-in-roof
Windows: Timber with a combination of single, double and secondary glazing
Energy: Typical annual energy use: 29,334 kWh
Annual energy use by area: 220 kWh/m² / 20.44 kWh/ft²
Carbon emissions per year: 6.1 tonnes

"We always want to ensure our properties are as energy efficient as they can be, for the longevity of the property but also to make the houses better for the tenants and for them to have lower bills.

We found the Whole House Plan really detailed and useful in telling us what we can do to make them more efficient."

Connie, Property Manager, Lucy Properties, Jericho, Oxford

What you can do...

Do you want to reduce your energy bills and cut carbon emissions? Would you like your house to be a healthier and more comfortable place to live? There are many different ways to make a building more energy efficient, whatever the house type, your personal circumstance and budget. Get ready to see the potential of your home...

Key: Low impact ● High impact ●●●●●●

Minor retrofit measures

Affordable and non-disruptive

	Comfort and health	Disruption
Low energy lighting	●	●
Secondary glazing from single glazing	●●●●●	●
Increase loft insulation to 300mm	●●●●	●●
New insulated front door	●●●●●	●●
Ventilation improvements	●●●●●●	●●

Insulate timber floors.
Drape membrane between floor joists and lay mineral wool snugly in between.

Major retrofit measures

Transformative, but more costly and disruptive

Upgrade room-in-roof insulation	●●●●●	●●●●●
Internal wall insulation	●●●●●	●●●●●●
Insulate suspended timber floors	●●●●●	●●●●●●
New double or triple glazed timber windows	●●●●●●	●●●●
Air Source Heat Pump	●●●●●●	●●●●

Internal insulation.
Woodfibre boards are applied to the inside of external walls and covered with lime plaster.

Renewables

Generate low carbon electricity

Solar PV	●	●●
----------	---	----

Ventilation.
Good ventilation and moisture extraction is very important in high occupancy houses.

What is an EPC?

An EPC is a great milestone, but it's just the start. While it measures energy efficiency, it doesn't guarantee maximum comfort, warmth, or cost savings – those come from a complete retrofit of your property.

An Energy Performance Certificate (EPC) rating tells you about the energy efficiency of your home.

- The score is out of 100 (the higher, the better).
- It's divided into performance bands A-G.

A higher score means a more energy-efficient home with lower running costs.

Current EPC rating for this house, and its potential rating

Do you live in a house like this?
You could qualify for a free government grant.

...and how you can achieve EPC rating C

Making improvements to the energy performance of your house is a journey. The table below shows the difference each energy saving action could have on this particular house's EPC, fuel bill and carbon footprint.* Grants may be available for some of these measures.

How to achieve EPC C rating	Estimated cost range	EPC rating	Estimated fuel bill	Estimated CO ₂ (tonnes)
Where you are now	Per measure	58 D	£2,412	6.11
Upgrade insulation in rooms-in-roof	£12,500 - £15,000	63 D	£2,110	5.25
Internal wall insulation (60 mm) to solid walls	£22,500 - £27,500	67 D	£1,845	4.50
Insulate suspended timber floors	£7,500 - £10,000	69 C	£1,729	4.17
Humidity controlled extractors in kitchen and bathroom, passive ventilation in other rooms	£2,500 - £4,500	69 C	£1,729	4.17

Installing solar PV

At this point, if you install solar PV, you could reduce your fuel bill to **£1,269**, your carbon emissions to **3.88 tCO₂** and improve your EPC to **78 C**.
Cost: £4,000 - £6,000.

Installing a heat pump

Or, if you install a heat pump, you could reduce your fuel bill to **£1,562**, your carbon emissions to **0.74 tCO₂** and improve your EPC to **75 C**.
Cost: £13,500 - £17,500.

Solar PV + heat pump

Install both solar and a heat pump and you could reduce your fuel bill to **£1,079**, your carbon emissions to **0.45 tCO₂** and improve your EPC to **84 B**.
Cost: £17,500 - £23,500.

For even greater comfort and health...

	Estimated cost range	EPC rating	Estimated fuel bill	Estimated CO ₂ (tonnes)
After Fabric Measures to C	Per measure	69 C	£1,729	4.17
Replace all windows with triple glazed timber windows	£28,000 - £42,000	71 C	£1,637	3.92
New insulated front door	£2,500 - £4,500	71 C	£1,627	3.89
Air Source Heat Pump with enhanced existing radiators and new hot water tank	£13,500 - £17,500	76 C	£1,471	0.70
Solar PV (2.5 kWp system) in a conservation area	£4,000 - £6,000	85 B	£989	0.41

*Savings are dependent on the retrofit measures being installed in the order shown. Cost to commission a new EPC at any stage to reflect retrofit updates, approx. £100.

Up to **£7,500 grant** towards a heat pump

Note: Figures are calculated using Parity Projects software from information gathered during a home energy survey. Parity Projects use nationally accepted methodology for calculations that underpin the Energy Performance Certificate (EPC) regime for all UK homes. Fuel bills are estimated and may differ from actual bills. The cost of the retrofit measures are indicative and based on current best estimates. Actual costs will vary depending on the choice of materials; the escalating costs of construction; and the availability of contractors.

Get started

The difference a retrofit can make

Georgie Stewart
Cosy Homes Oxfordshire
Scheme Manager

"Many Victorian houses have thin walls which lose a lot of heat. This house is in a conservation area so wall insulation would need to be applied internally, with care taken to use materials that are suitable for the house and the occupants."

Natasha Ginks
Cosy Homes Oxfordshire
Retrofit Coordinator

"If internal wall insulation is being applied, it's a great time to tackle the draughts and heat loss from suspended timber floors. Membranes and airtight tapes are used to create a cradle which holds flexible insulation material in place between the floor joists."
